

Remittance Tool - Developer Documentation

Generated on 2026-02-04

Overview

Remittance Tool is a Frappe module for capturing outbound remittance data, including company/vendor master data, tax details, and invoice and tax-document line items. The central transaction doctype is **Remittance** with two child tables: **Remittance Invoice** and **Remittance Tax Document**.

Key Doctypes

Transaction

- Remittance** (autoname: REM-.YYYY.-.#####)

Masters

- Remittance Company
- Remittance Vendor
- Remittance Country
- Remittance Currency
- Remittance Purpose Code
- Remittance Nature
- Remittance Bank Branch
- Remittance Tax Document Type

Child Tables

- Remittance Invoice (child of Remittance)
- Remittance Tax Document (child of Remittance)

Remittance: Field Highlights

- Core references: company, vendor, country_of_residence, country_to_remit, currency
- Amounts: amount_payable_foreign/inr, exchange_rate, gross/net/tds fields
- Tax details: tds_rate_income_tax_act, tds_rate_dtaa, gross_up, trc_obtained, dtaa fields
- SAP references: sap_company_code, sap_document_no, sap_invoice_no, document_date
- Child tables: invoices, tax_documents

Child Table Schemas

Child DocType	Important Fields
Remittance Invoice	sap_document_no, invoice_no, document_date, currency, vat_amount, invoice_amount, gross_amount, tds_amount, net_amount, inr_value, exchange_rate
Remittance Tax Document	tax_document_type, document_year, document_no, received, attachment

Master Schemas (Summary)

Master	Key Fields
Remittance Company	company_code, company_name, pan, tan, email_id, status_of_remitter, residential_status, address
Remittance Vendor	vendor_code, vendor_name, beneficiary_flag, tax_id_no, pan, contact, address, country_of_residence
Remittance Country	country_name, country_code, iso_code
Remittance Currency	currency_code, currency_name, symbol
Remittance Purpose Code	purpose_code, description, category, active
Remittance Nature	nature_of_remittance, gl_description, article_of_it, section_of_act, default_tds_rate, dtaa_article
Remittance Bank Branch	bank_name, branch_name, bsr_code, address, city, state, country

Remittance Tax Document Type	document_type, description
------------------------------	----------------------------

APIs

Master Data API

File: `remittance_tool/api/master.py`

- `get_master_data(doctype, fields=None, filters=None, limit=200)`
 - Only allows doctypes in `ALLOWED_MASTER_DOCTYPES`.
 - Returns data via `frappe.get_all`.
- `upsert_master_data(doctype, data)`
 - Creates or updates master data. Accepts JSON string or dict.
 - If `name` exists, it updates the document, else inserts a new one.

SAP Integration API

File: `remittance_tool/api/sap.py`

- `create_remittance_from_sap(payload)`
 - Creates a Remittance document from an external payload.
 - Copies top-level fields directly to Remittance.
 - Appends `invoices` and `tax_documents` arrays to child tables.
 - Returns the created Remittance name.

UI Customizations (JS)

Each doctype now has a matching `.js` file for UI customizations. Current files include: `remittance.js`, `remittance_company.js`, `remittance_vendor.js`, `remittance_bank_branch.js`, `remittance_currency.js`, `remittance_country.js`, `remittance_nature.js`, `remittance_purpose_code.js`, `remittance_tax_document_type.js`, `remittance_tax_document.js`, `remittance_invoice.js`.

These files currently include a minimal `refresh` hook as a placeholder for future UI logic (hide/show fields, custom buttons, client-side validation, etc.).

Permissions

Remittance doctype grants create/read/write/delete/report/print/email/export permissions to the **System Manager** role. (Other doctypes inherit default permissions. Review or extend permissions as needed.)

Typical Workflow (Developer View)

1. Create or import master data (Company, Vendor, Country, Currency, etc.).
2. Create a Remittance record from UI or SAP API.
3. Populate invoices and tax documents child tables.
4. Compute tax/amount details via custom logic (server/client, as needed).

Notes for Extension

- Server logic: add validations or calculations in respective `doctype/*.py` files.
- Client logic: add UI rules in `doctype/*.js` files.
- API: use `frappe.whitelist()` methods in `api/` for integrations.
